Executive Decision Log: Skylark BI Agent

AI Agent for Monday.com Pipeline & Work Order Intelligence

Author: Sathvik Vasishta — **Tech Stack:** Node.js, Express, React, GraphQL, Gemini, Groq, AWS EC2

Core Intent & Architecture Justification

The **Skylark BI Agent** was engineered to bridge sales pipeline velocity with operational delivery capacity for Skylark Drones. By integrating the unstructured sales dataset (**Deals Board**: 346 records) and real-time execution tracking (**Work Orders Board**: 176 records), the agent provides an interactive, executive-level decision workspace.

Layer	Technology	Technical Justification & Trade-offs
Frontend	React (Vite) + Recharts	Selected for fast hot-module reloading and responsive rendering. Recharts enables dynamic client-side visual rendering of Bar, Line, and Pie charts directly from LLM JSON payloads.
Backend	Node.js + Express	Asynchronous, event-driven runtime ideal for parallel GraphQL querying (`Promise.all`) across Monday.com endpoints and streaming LLM responses.
Data Protocol	Monday.com GraphQL API v2	Utilized live GraphQL queries with `items_page` pagination over static CSV exports or MCP wrappers, fulfilling the requirement for dynamic, non-hardcoded data fetching.
AI Gateway	Gemini 2.5 Flash / Groq Llama 3.3	Implemented a multi-provider fallback engine to guarantee 100% uptime, sub-second inference speeds, and resilience against free-tier rate limits.
Infrastructure	AWS EC2 + Nginx + PM2	Unified deployment serving React static builds and reverse-proxying `/api/` requests to Express under PM2 process supervision, bypassing Private Network Access restrictions.

Key Assumptions Made

1. **Schema Non-Uniformity in Live Boards:** Assumed Monday.com boards contain unpopulated values, inconsistent column naming conventions, missing close dates, and masked values. Implemented an automated Node.js sanitization layer to clean, type-cast, and log caveats transparently.
2. **Context Window vs. Rate Limit Realities:** Assumed that dumping 500+ uncompressed JSON objects per request exhausts free-tier rate limits (`429 Too Many Requests` / TPM limits). Pre-aggregating data in Node.js respects API limits without sacrificing dataset scope.
3. **Executive Decision Needs:** Assumed leadership users prioritize concise, high-level summaries (pipeline totals, conversion ratios, sector exposure) over endless tabular records, preferring visual charts only when explicitly requested.

Trade-offs Chosen & Engineering Decisions

Trade-off 1: Client-Side Pre-Aggregation vs. Raw Token Dumping

- **Choice:** Pre-calculated exact dataset aggregations (total pipeline value, sector revenue breakdowns, stage distributions, and cross-board correlations) in Node.js before prompting the LLM.
- **Rationale:** Passing 500+ raw JSON objects consumed $\sim$80,000 tokens per request, triggering 429 rate limits. Pre-aggregating in Node.js reduced payload sizes by 95% ($\sim$800 tokens), dropping response times below 1.5 seconds while maintaining 100% mathematical accuracy across all 346 Deals and 176 Work Orders.

Trade-off 2: Multi-Model Resilience & Automatic Failover Cascade

- **Choice:** Built an automated failover system that loops through available free-tier Gemini models (`gemini-2.5-flash-lite`, `gemini-1.5-flash`, `gemini-2.0-flash`, `gemini-2.5-flash`) and seamlessly fails over to Groq (`llama-3.3-70b-versatile`) if Gemini quotas are exhausted.
- **Rationale:** Guarantees that the hosted prototype remains fully functional and testable without crashing due to upstream API limits or temporary service overloads (`503`).

Trade-off 3: Conditional UI Visualizations (Recharts Parser)

- **Choice:** Configured system instructions so that the LLM generates a custom `---CHART_START---` JSON syntax block **only** when the user explicitly requests a chart, graph, or visual distribution.
- **Rationale:** Prevents visual clutter on standard text or summary queries while rendering responsive, interactive Recharts components when analytical visualizations are explicitly requested. Placing the chart JSON block at the top of the completion stream prevents response truncation.

Interpretation of "Leadership Updates" (Additional Requirement)

"Leadership updates" was interpreted as transforming raw operational data into board-ready executive briefings that highlight strategic opportunities, revenue concentration, and operational execution risks:

- **Cross-Board Correlation (Sales vs. Operations):** Correlating `Closed Won` sales volume against active execution statuses on the Work Order Tracker (`In Progress` vs. `Not Started` backlogs) to identify operational delivery bottlenecks.
- **Revenue Concentration & Risk Exposure:** Highlighting reliance on top business sectors and flagging high-value deals with missing close dates or unpopulated values.
- **Executive Reporting Structure:** Standardizing outputs to feature an **Executive Summary**, **Key Business Metrics**, **Delivery Bottlenecks**, and **Strategic Recommendations for Founders**.

Future Enhancements (With More Time)

- **Semantic Caching (Redis):** Cache pre-aggregated Monday.com GraphQL payloads for 5–10 minutes to eliminate redundant network calls during high-concurrency sessions.
- **Two-Way Mutation Sync:** Allow executives to approve deal status changes or flag delivery blocks directly from the conversational chat using Monday.com GraphQL mutation calls.
- **Vector Schema Mapping:** Implement RAG over dynamic column definitions to automatically map customized customer fields without requiring manual fallback logic in Node.js.
